

The Impact of Weather on a Film's Theatrical Launch

Os colegas da Francisca

Scope/Intro

- Is it possible to correlate the impact of the weather on past ticket sales by looking at Comscore daily sales values for Portugal?
- Is it possible to correlate the impact of weather throughout a film's release with the total sales value using Opus Data dataset?
- Attempt to correlate changes in the weather with a decrease or increase in cinema ticket sales.

Impact of the weather on daily cinema tickets sales

Dataset: Daily sales values for Portugal, of the films Glass and Mary, the Queen of Scotch, analyzed between the 17th of January and the 27th of February (comscore dataset) as well as the weather information for these period of time (AccuWeather)

Measure the impact of the weather on cinema ticket sales week by week, comparing 'good' weeks with 'bad' weeks, and comparing 'good' days in 'bad' weeks with 'bad' days in 'good' weeks.

Temperatures rose linearly however that can be misleading because as time passes ticket sales lower

Daily gross and precipitation

Unexpected days

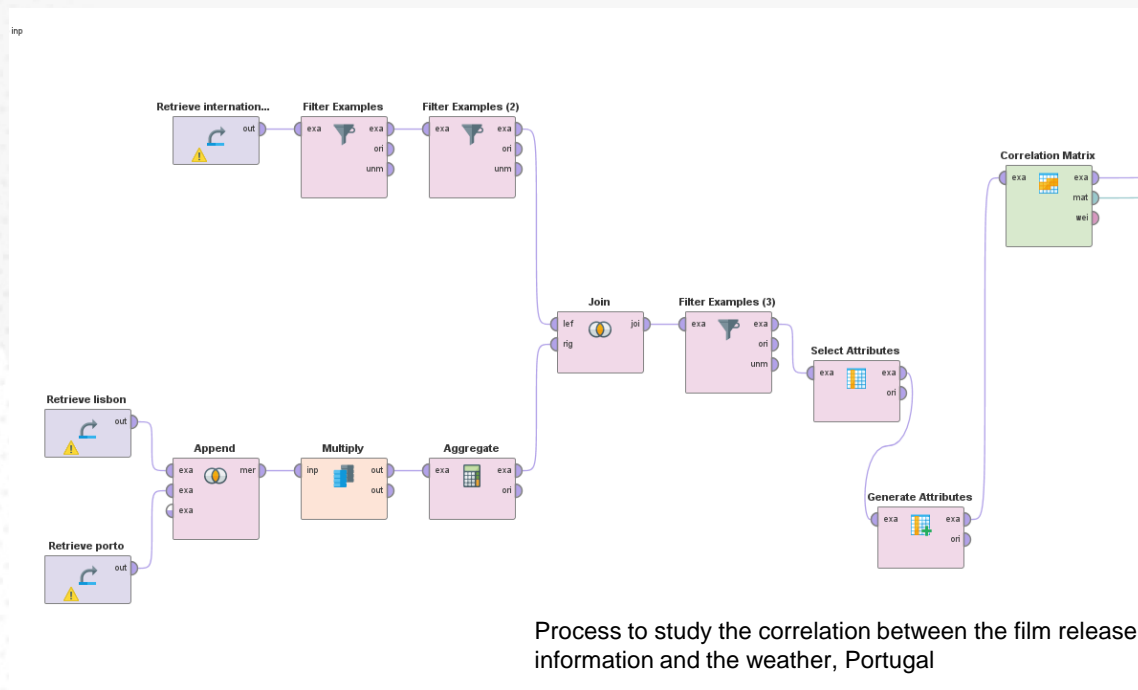

- Events as Valentines Day
- As weeks pass the percentage levels and mondays have more affluence

Impact of weather on a film release

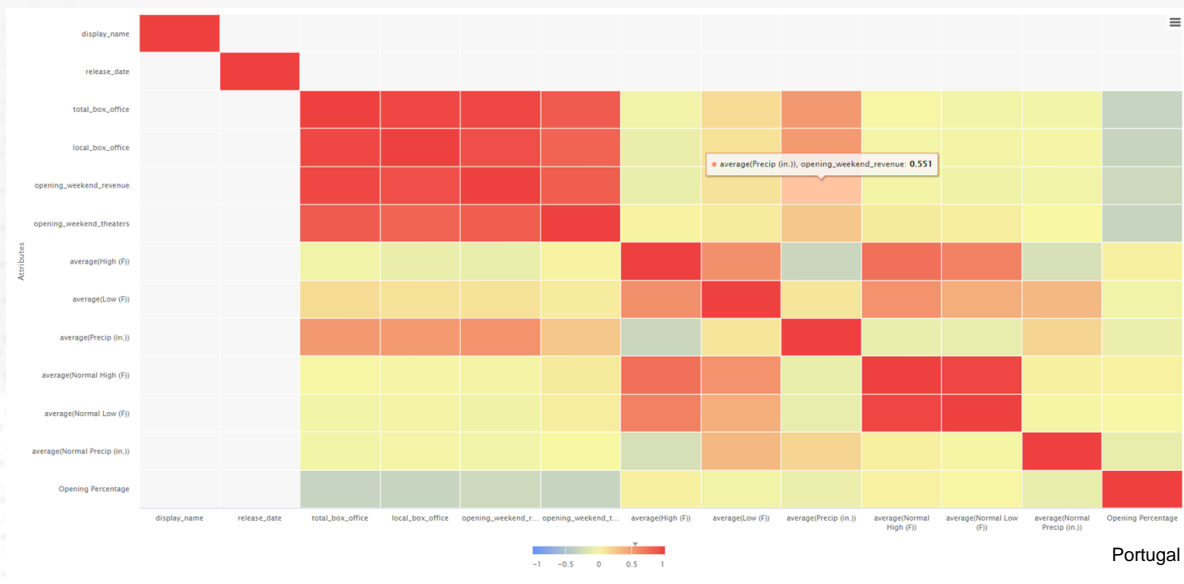

- Used film release information from Opus Data and crossed the release data with the weather dataset
- Studied correlation on the United Kingdom and Portugal
- Dataset: 173 films in the UK and 87 films in Portugal

Outcomes

- In Portugal, there seems to be a correlation between the weather (especially precipitation) and the success of a film launch
- In the UK that does not seem to happen, as the correlation between them was close to 0

Approximately 0.551 correlation between precipitation and the opening weekend revenue

Hypothesis: The different sun exposure and culture of each country has an effect on how people are affected by the weather (Source: [Current Results](#), 2021)

Predicting the film's launch success

- The sample used for creating this model was the film's launched between the 1st of January and the 31st of March 2019, in Portugal (79 films after cleansing)
- It was taken into account the genre of the film and its production size as well
- Our target was the 'Opening Percentage' $(\text{opening_weekend_revenue} / \text{total_box_office}) * 100$
- Applied k-NN to create the model

Conclusions - Portugal/UK Weather Model

- Advantages:

- Can predict in more or less reliably the impact of the theatrical launch of a film
- The impact of the weather was noticed, when removed the model would have worst performance
- The process created is easily used for other datasets
- The Portugal model achieved better results, what cements our hypothesis

- Disadvantages:

- Valid for a short period of time (01/01 - 31/03)
- Only valid for the said countries

PerformanceVector

PerformanceVector:

root_mean_squared_error: 13.419 +/- 4.774 (micro average: 14.123 +/- 0.000)
correlation: 0.327 +/- 0.387 (micro average: 0.235)

Model for UK

PerformanceVector

PerformanceVector:

root_mean_squared_error: 14.218 +/- 3.979 (micro average: 14.751 +/- 0.000)
correlation: 0.510 +/- 0.389 (micro average: 0.770)

Model for Portugal
